

This IC, developed by CMOS technology, is a high-accuracy Hall effect switch IC that operates at a low voltage and low current consumption. The output voltage changes when this IC detects the intensity level of magnetic flux density. Using this IC with a magnet makes it possible to detect the open / close in various devices.

High-density mounting is possible by using the small SOT-23-3 or the super-small SNT-4A package.

Due to its low voltage operation and low current consumption, this IC is suitable for battery-operated portable devices. Also, due to its high-accuracy magnetic characteristics, this IC can make operation's dispersion in the system combined with magnet smaller.

ABLIC Inc. offers a "magnetic simulation service" that provides the ideal combination of magnets and our Hall ICs for customer systems. Our magnetic simulation service will reduce prototype production, development period and development costs. In addition, it will contribute to optimization of parts to realize high cost performance.

**\*1.**  $B_{OPN}$ ,  $B_{OPS}$ : Operation points

$B_{OPN}$  and  $B_{OPS}$  are the values of magnetic flux density when the output voltage ( $V_{OUT}$ ) changes after the magnetic flux density applied to this IC by the magnet (N pole or S pole) is increased (by moving the magnet closer).  
 Even when the magnetic flux density exceeds  $B_{OPN}$  or  $B_{OPS}$ ,  $V_{OUT}$  retains the status.

**\*2.**  $B_{RPN}$ ,  $B_{RPS}$ : Release points

$B_{RPN}$  and  $B_{RPS}$  are the values of magnetic flux density when the output voltage ( $V_{OUT}$ ) changes after the magnetic flux density applied to this IC by the magnet (N pole or S pole) is decreased (the magnet is moved further away).  
 Even when the magnetic flux density falls below  $B_{RPN}$  or  $B_{RPS}$ ,  $V_{OUT}$  retains the status.

**\*3.**  $B_{HYSN}$ ,  $B_{HYSS}$ : Hysteresis widths

$B_{HYSN}$  and  $B_{HYSS}$  are the difference between  $B_{OPN}$  and  $B_{RPN}$ , and  $B_{OPS}$  and  $B_{RPS}$ , respectively.

**Remark** The unit of magnetic density mT can be converted by using the formula  $1 \text{ mT} = 10 \text{ Gauss}$ .

■ Operation

1. Direction of applied magnetic flux

This IC detects the flux density which is vertical to the marking surface.

Figure 11 and Figure 12 show the direction in which magnetic flux is being applied.

**3. Basic operation**

This IC changes the output voltage level ( $V_{OUT}$ ) according to the level of the magnetic flux density (N pole or S pole) applied by a magnet.

The following explains the operation when the output logic is active "L".

**3.1 Product with omnipolar detection**

When the magnetic flux density vertical to the marking surface exceeds the operation point ( $B_{OPN}$  or  $B_{OPS}$ ) after the S pole or N pole of a magnet is moved closer to the marking surface of this IC,  $V_{OUT}$  changes from "H" to "L". When the S pole or N pole of a magnet is moved further away from the marking surface of this IC and the magnetic flux density is lower than the release point ( $B_{RPN}$  or  $B_{RPS}$ ),  $V_{OUT}$  changes from "L" to "H".

**Figure 15** shows the relationship between the magnetic flux density and  $V_{OUT}$ .

**Figure 15**

**3.2 Product with S pole detection**

When the magnetic flux density vertical to the marking surface exceeds  $B_{OPS}$  after the S pole of a magnet is moved closer to the marking surface of this IC,  $V_{OUT}$  changes from "H" to "L". When the S pole of a magnet is moved further away from the marking surface of this IC and the magnetic flux density is lower than  $B_{RPS}$ ,  $V_{OUT}$  changes from "L" to "H".

**Figure 16** shows the relationship between the magnetic flux density and  $V_{OUT}$ .

**Figure 16**

### 3.3 Product with N pole detection

When the magnetic flux density vertical to the marking surface exceeds  $B_{OPN}$  after the N pole of a magnet is moved closer to the marking surface of this IC,  $V_{OUT}$  changes from "H" to "L". When the N pole of a magnet is moved further away from the marking surface of this IC and the magnetic flux density is lower than  $B_{RPN}$ ,  $V_{OUT}$  changes from "L" to "H".

**Figure 17** shows the relationship between the magnetic flux density and  $V_{OUT}$ .

**Figure 17**

#### 4. Time dependency in the current consumption

This IC performs the intermittent operation, and operates at low current consumption due to repeating the sleep mode ( $t_{SL}$ ) and the awake mode ( $t_{AW}$ ).

Figure 18 shows the time dependency in the current consumption.

Figure 18

**5. Timing chart**

Figure 19 shows the operation timing of this IC.

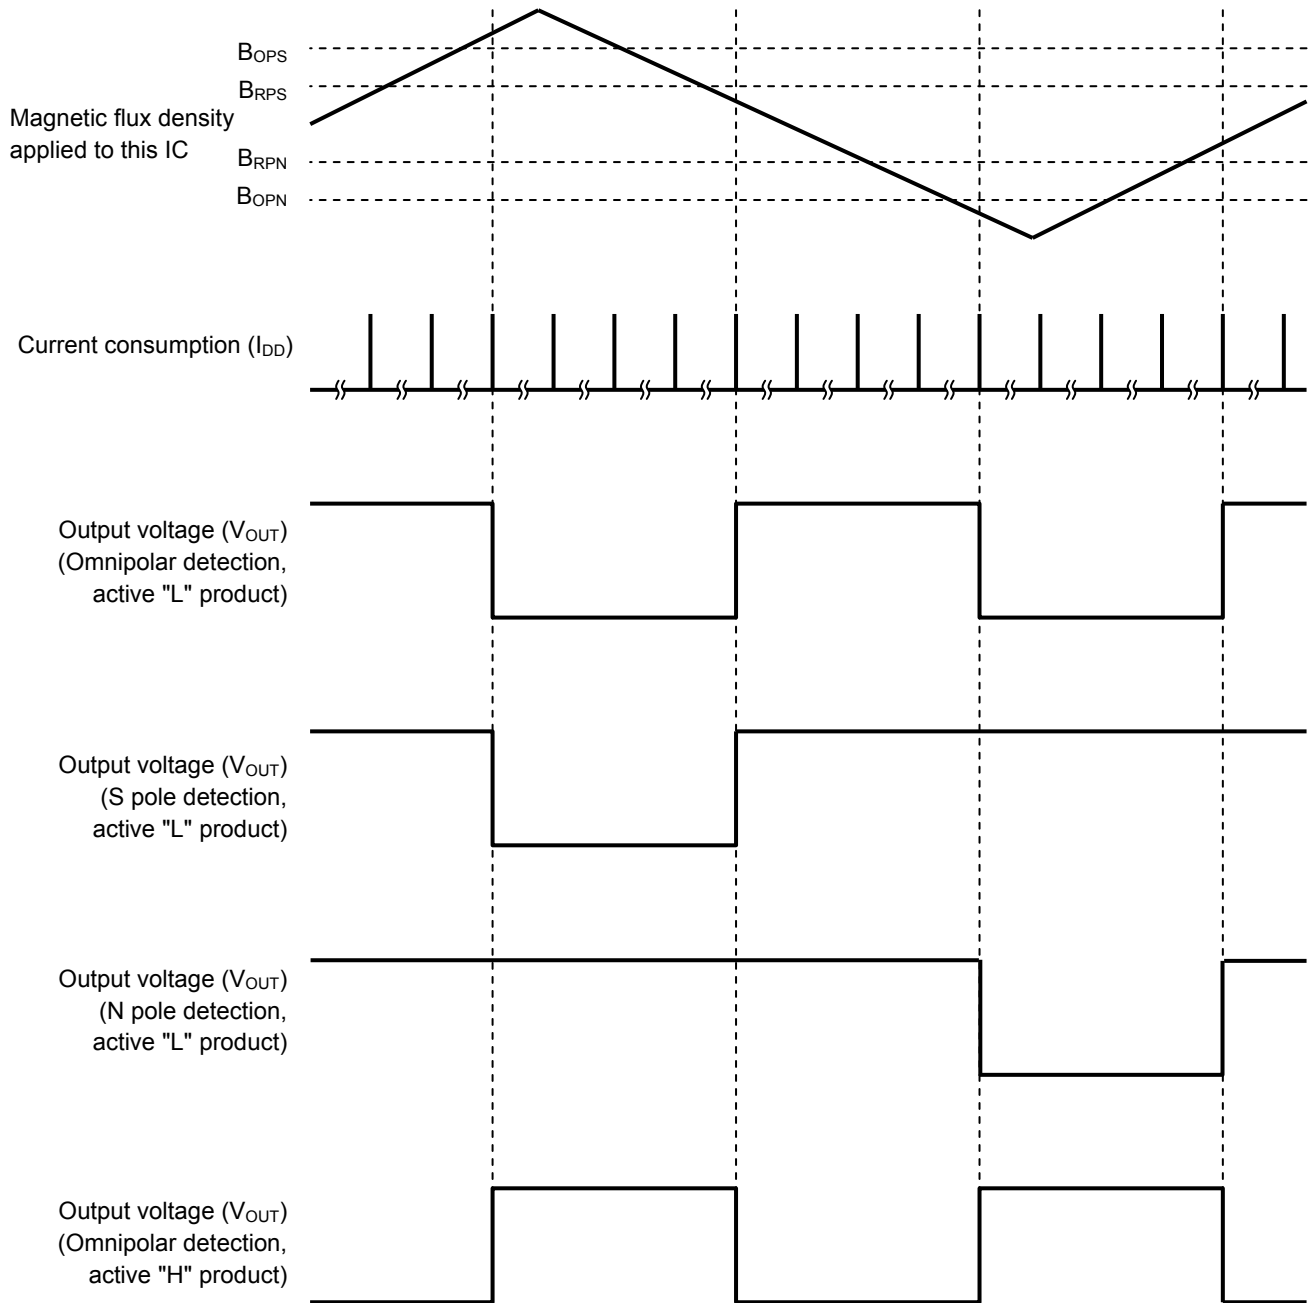

Figure 19

■ **Precautions**

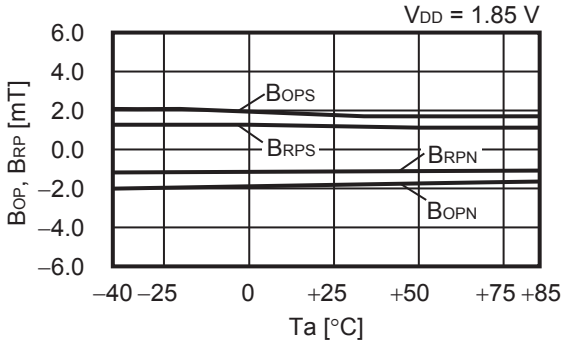

- If the impedance of the power supply is high, the IC may malfunction due to a supply voltage drop caused by feed-through current. Take care with the pattern wiring to ensure that the impedance of the power supply is low.
- Note that the IC may malfunction if the power supply voltage rapidly changes.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- Large stress on this IC may affect the magnetic characteristics. Avoid large stress which is caused by the handling during or after mounting the IC on a board.
- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.
